## Description

Minesweeper Have you ever played Minesweeper? This cute little game comes with a certain operating system whose name we can't remember. The goal of the game is to find where all the mines are located within a  $M \times N$  field. The game shows a number in a square which tells you how many mines there are adjacent to that square. Each square has at most eight adjacent squares. The  $4 \times 4$  field on the left contains two mines, each represented by a `\*` character. If we represent the same field by the hint numbers described above, we end up with the field on the right: \*... .... \*. ... \*100 2210 1\*10 1110

## Input

The input will consist of an arbitrary number of fields. The first line of each field contains two integers  $n$  and  $m$  ( $0 < n, m < 100$ ) which stand for the number of lines and columns of the field, respectively. Each of the next  $n$  lines contains exactly  $m$  characters, representing the field. Safe squares are denoted by `.` and mine squares by `\*`, both without the quotes. The first field line where  $n = m = 0$  represents the end of input and should not be processed.

## Output

For each field, print the message Field #x: on a line alone, where  $x$  stands for the number of the field starting from 1. The next  $n$  lines should contain the field with the `.` characters replaced by the number of mines adjacent to that square. There must be an empty line between field outputs.

## Samples

input

Copy

```
4 4
*...
....
*...
....
3 5
**...
....
*...
0 0
```

output

Copy

```
Field #1:
*100
```

```
2210
1*10
1110

Field #2:
**100
33200
1*100
```
