Description

The National Intelligence Council of Nation X receives a piece of credible information that *Nation Y* will send spies to steal *Nation X*'s confidential paper. So the commander of *The National Intelligence Council* take measures immediately.

He will investigate people who will come into *Nation X*. At the same time, there are two List in the Commander's hand, one is full of spies that *Nation Y* will send to *Nation X*, and the other one is full of spies that *Nation X* has sent to *Nation Y* before. There may be some overlaps of the two list. Because the spy may act two roles at the same time, which means that he may be the one that is sent from *Nation X* to *Nation Y*, we just call this type a "dual-spy". So *Nation Y* may send "dual_spy" back to *Nation X*, and it is obvious now that it is good for *Nation X*, because "dual_spy" may bring back *Nation Y*'s confidential paper without worrying to be detention by *Nation Y*'s frontier. So the commander decides to seize those that are sent by *Nation Y*, and let the ordinary people and the "dual_spy" in at the same time .So can you decide a list that should be caught by the Commander?

A: the list contains that will come to the *Nation X*'s frontier.

B: the list contains spies that will be sent by *Nation Y*.

C: the list contains spies that were sent to *Nation Y* before.

Input

There are several test cases.

Each test case contains four parts, the first part contains 3 positive integers A, B, C (A, B, C are all less than 1000), and A is the number which will come into the frontier. B is the number that will be sent by *Nation Y*, and C is the number that *Nation X* has sent to *Nation Y* before. The second part contains A strings, the name list of that will come into the frontier. The third part contains B strings, the name list of that are sent by *Nation Y*. The fourth part contains C strings, the name list of the "dual_spy". There will be a blank line after each test case.

There won't be any repetitive names in a single list, if repetitive names appear in two lists, they mean the same people.

Output

Output the list that the commander should caught (in the appearance order of the lists B).if no one should be caught, then , you should output "No enemy spy".

Samples

input	Copy
<pre>8 4 3 Zhao Qian Sun Li Zhou Wu Zheng Wang Zhao Qian Sun Li Zhao Zhou Zheng 2 2 2 Zhao Qian Zhao Qian Zhao Qian</pre>	
output	Copy
<pre>Qian Sun Li No enemy spy</pre>
