Description

Xiao Ming is only seven years old, Now I give him some numbers, and ask him what is the second largest sum if he can choose a part of them (at least one). For example, if I give him 1, 2, 3, then he should tell me 5 as 6 is the largest and 5 is the second. I think it is too hard for him, isn't it?

Input

Standard input will contain multiple test cases. The first line of the input is a single integer T ($1 \leq T \leq 10$) which is the number of test cases. And it will be followed by T consecutive test cases.

Each test case starts with a line containing an integer N ($1 < N < 10$), the number I give Xiao Ming. The second line contains N Integer numbers a_i ($-10 < a_i < 10$),

Output

For each test case, output the answer.

Samples

input	Copy
<pre>2 3 1 2 3 4 0 1 2 3</pre>	
output	Copy
<pre>5 5</pre>
