Description

The magician shuffles a small pack of cards, holds it face down and performs the following procedure:

- The top card is moved to the bottom of the pack. The new top card is dealt face up onto the table. It is the Ace of Spades.
- Two cards are moved one at a time from the top to the bottom. The next card is dealt face up onto the table. It is the Two of Spades.
- Three cards are moved one at a time...
- This goes on until the n th and last card turns out to be the n of Spades.

This impressive trick works if the magician knows how to arrange the cards beforehand (and knows how to give a false shuffle). Your program has to determine the initial order of the cards for a given number of cards, $1 \leq n \leq 13$.

Input

On the first line of the input is a single positive integer, telling the number of test cases to follow. Each case consists of one line containing the integer n .

Output

For each test case, output a line with the correct permutation of the values 1 to n , space separated. The first number showing the top card of the pack, etc...

Samples

input	Copy
2 4 5	
output	Copy
2 1 4 3 3 1 4 5 2
