Description

Problem E: Edit Step Ladders

An *edit step* is a transformation from one word x to another word y such that x and y are words in the dictionary, and x can be transformed to y by adding, deleting, or changing one letter. So the transformation from *dig* to *dog* or from *dog* to *do* are both edit steps. An *edit step ladder* is a lexicographically ordered sequence of words $w_1, w_2, \dots, w_n$ such that the transformation from w_i to w_{i+1} is an edit step for all i from 1 to $n-1$.

For a given dictionary, you are to compute the length of the longest edit step ladder. The input to your program consists of the dictionary - a set of lower case words in lexicographic order - one per line. No word exceeds 16 letters and there are no more than 25000 words in the dictionary. The output consists of a single integer, the number of words in the longest edit step ladder.

Samples

input

Copy

```
cat
dig
dog
fig
fin
fine
fog
log
wine
```

output

Copy

```
5
```
