Description

Problem E: Relatives

Given n , a positive integer, how many positive integers less than n are relatively prime to n ? Two integers a and b are relatively prime if there are no integers $x > 1, y > 0, z > 0$ such that $a = xy$ and $b = xz$.

There are several test cases. For each test case, standard input contains a line with $n \leq 1,000,000,000$. A line containing 0 follows the last case.

For each test case there should be single line of output answering the question posed above.
