Description

Given a base b and two non-negative base b integers p and m , compute $p \bmod m$ and print the result as a base b integer. $p \bmod m$ is defined as the smallest non-negative integer k such that $p = a \cdot m + k$ for some integer a .

Input consists of a number of cases. Each case is represented by a line containing three unsigned integers. The first, b , is a decimal number between 2 and 10. The second, p , contains up to 1000 digits between 0 and $b-1$. The third, m , contains up to 9 digits between 0 and $b-1$. The last case is followed by a line containing 0.

For each test case, print a line giving $p \bmod m$ as a base- b integer.

Samples

input

Copy

```
2 1100 101
10 123456789123456789123456789 1000
0
```

output

Copy

```
10
789
```
