Description

Farmer Zhao's N cows ($1 \leq N \leq 1,000,000$) are lined up in a row. So each cow can see the nearest cow which is taller than it. You task is simple, given the *height* ($0 < height \leq 10^9$) of each cow lined up in the row, to calculate the distance between each cow and its nearest taller cow (the nearest cow which is taller than him), if it is the tallest cow in the row, such distance is regarded as n . You should output the average distance.

Input

For each test case:

Line 1: One integers, N

Lines 2: N integers. The i -th integer is the height of the i th cow in the row.

Output

The average distance to their nearest taller cow, rounded up to 2 decimals.

Samples

input	Copy
<pre>7 7 6 5 8 6 4 10</pre>	
output	Copy
<pre>2.43</pre>	

Hint

You may suffer a precision problem. To ensure that you can output a correct answer on OJ(Online Judge), please write your output statements like it:

```
#define eps 1e-7
.....
printf("%.2f\n", sum/n+eps);
```
