Description

大家已经学习过了链表，现在考虑这样一个问题：对于给定的两条有头节点的有序递增链表，你需要将他合并成一条有头节点的有序递增链表。

另外，新的链表上的每个节点均为原来的两条链表上的节点，即在合并完成之后，原来的 两条两边变成空链表。

操作如图所示

你只需要提交 List merge(List L1,List L2)函数即可
主体代码如下：

```
1#include <stdio.h>
2#include <stdlib.h>
3
4typedef int ElementType;
5typedef struct Node *PtrToNode;
6struct Node {
7    ElementType Data;
8    PtrToNode    Next;
9};
10typedef struct Node Node;
11typedef PtrToNode List;
12
13List Read()
14{
15    List head = (List)malloc(sizeof (Node));
16    head->Next = NULL;
17    List now = head;
18    int n;
19    scanf("%d", &n);
20    for (int i = 0; i < n; i++)
21    {
22        List tmp = (List)malloc(sizeof(Node));
23        tmp->Next = NULL;
24        scanf("%d", &tmp->Data);
25        now->Next = tmp;
```

```
26  now = now->Next;
27  }
28  return head;
29}
30void Print(List L)
31{
32  int cot = 0;
33  List now = L->Next;
34  while (now)
35  {
36    if (cot)printf(" ");
37    cot++;
38    printf("%d", now->Data);
39    now = now->Next;
40  }
41  if (!cot)printf("NULL");
42  printf("\n");
43}
44
45
46List Merge(List L1, List L2);
47
48
49int main()
50{
51  List L1, L2, L;
52  L1 = Read();
53  L2 = Read();
54  L = Merge(L1, L2);
55  Print(L);
56  Print(L1);
57  Print(L2);
58  return 0;
59}
60/*你的代码会被嵌在这里*/
```
